

TOPIC	QUESTIONS	ANSWERS
1. PnP Poweshell	Can the open source tools PnP PowerShell ( <a href="https://github.com/pnp/pnp-powershell">https://github.com/pnp/pnp-powershell</a> ) be used for exporting/importing templates (PnP Provisioning Templates)?	At JWC, we do not have any possibility to use PnP-Powershell (or similar). These tools can be used by the supplier, to create the exportable files – however, they cannot be used at JWC to import the templates, further modify the sites, or rebuild the solution manually (which must be possible if issues arise with importing on the classified network). Due to the complex security policies with our classified network, we are requiring full documentation (in addition to the exportable templates/sites) so that we have the ability to manually rebuild the solution in the event that we run into problems with the templates being brought into the classified network/servers. JWC webmaster must be able to rebuild the sites using only workflows in SharePoint designer and CSS (javascript and any other custom code is strictly prohibited).
2. Development environment	Will JWC NATO provide a environment for developing the templates for the solution, or should the supplier host and provide this during the project period for the team?	Unfortunately we are unable to provide a development environment due to our servers and licenses being on the Classified network. We will, however, set up our environment based on the recommendations from the supplier (i.e., using SPS 2016 or 2019, enabling site features, etc.). Additionally, due to the complex security policies with our classified network, we are requiring fully documentation (in addition to the exportable templates/sites) so that we have the ability to manually rebuild the solution in the event that we run into problems with the templates being brought into the classified network/servers.
3. App Store	Does the SharePoint 2019	The JWC SharePoint environment is standalone and isolated from any

	<p>environment support App Store, and if so will it be allowed to use apps provided as open source by Microsoft or other vendors?</p>	<p>Internet and App Store. If there is an existing App which could support the solution, and run on an isolated SharePoint environment, then JWC can investigate whether the solution would be approved on our network – however, given that the approval process for 3<sup>rd</sup> party apps and tools is lengthy, we cannot guarantee at this point in time, whether it would be approved. Therefore, we recommend assuming no possibility of the using Apps for the purposes of bid.</p>
<p>4. Visual Studio</p>	<p>Is it allowed to use Visual Studio to implement the required customizations and deploy it using WSP package? Can custom developed webparts, workflows, server side code, such as event receivers, timerjobs (all standard SharePoint features) be used to accommodate the requirements?</p>	<p>At JWC, we do not have any possibility to use Visual Studio. These tools can be used by the supplier, to create the exportable files – however, they cannot be used at JWC to import the templates, further modify the sites, or rebuild the solution manually (which must be possible if issues arise with importing on the classified network). Due to the complex security policies with our classified network, we are requiring full documentation (in addition to the exportable templates/sites) so that we have the ability to manually rebuild the solution in the event that we run into problems with the templates being brought into the classified network/servers. JWC webmaster must be able to rebuild the sites using only workflows in SharePoint designer and CSS (javascript and other custom code, despite being standard SharePoint, is strictly prohibited).</p>
